

## **State Regulators Workshop on Geologic Sequestration of CO<sub>2</sub>**

The Environmental Protection Agency (EPA), in coordination with the Department of Energy's National Energy Technology Laboratory (NETL), and the Ground Water Protection Council (GWPC) held a workshop on geologic sequestration of carbon dioxide (CO<sub>2</sub>) on January 24, 2007 in San Antonio, Texas. At the workshop, representatives of state governments, EPA Regions, DOE research laboratories and Regional Partnerships, industry, non-governmental organizations (NGOs), academia, and other interested parties met in small groups to discuss issues associated with CO<sub>2</sub> injection for the purposes of geologic sequestration (GS).

Participants were asked to formulate questions and identify research needs to be addressed as EPA prepares to develop a scientifically-sound management strategy for CO<sub>2</sub> injection. The participants were organized into groups of 8 to 10 people, with each group having a mix of representatives from EPA regions, states, industry, research institutions, academia, and NGOs, to allow for sharing various points of view.

The group discussed and raised questions, comments, and observations on the following topics: site characterization; modeling; area of review (AoR); injection well construction; mechanical integrity testing (MIT); measuring, monitoring, and verification (MMV); closure and post-closure care; and liability and financial responsibility.
